

Question 1 - Determining Sales Bonuses (Single Alternative Decision Structure)

Calculate the bonus for an employee based on their sales performance. If an employee's sales exceed R5000, award them a bonus of R500. After the calculation, display the bonus and the salary.

```
Please enter your sales: 6000
Your bonus: 500.0
Your sales: 6000.0
```

Question 2 - Checking Payment Status (Single Alternative Decision Structure)

Implement a system to verify if a customer has paid their balance adequately. If the payment amount differs from the balance, notify the customer that they have not paid enough. Additionally, if a customer's balance is \$0, inform them that they have Insufficient Funds. After the verification, display any necessary notifications regarding payment status.

```
Please enter you balance:50000
Please enter the payment amount:2000
You did not pay enough
```

Question 3 - Weather Temperature Evaluation (Dual Alternative Decision Structure)

Evaluate the weather based on the temperature input. If the temperature is below 40 degrees, prompt the user with "A little cold, isn't it?" Otherwise, respond with "Nice weather we're having."

```
Please enter the temperature:50
Nice weather we're having.
```

Question 4 - Salary Comparison (Dual Alternative Decision Structure)

Compare an individual's salary input with a benchmark. If the salary is less than or equal to R20,000, classify it as "Small Salary"; otherwise, categorize it as "Big Salary."

```
Please enter your salary:20000
Small Salary
```

Question 5 - Loan Qualification Assessment (Dual Alternative Decision Structure)

Determine eligibility for a loan based on specific criteria. If an individual's salary is at least \$30,000 per year and they have been employed for at least two years, inform them that they qualify for a loan. Otherwise, provide appropriate feedback regarding the requirements not met.

```
Please enter your Salary: 35000
Please enter your years on job: 2
You qualify for a loan
```

Question 6 - Comparing Usernames (String Comparison)

Compare two usernames, "User1" and "User2", and determine their order based on ASCII values. After the comparison, print whether "User1" is greater than, less than or equals to "User2".

```
Enter the first User 1: Mary
Enter the first User 2: Mark
Mary > Mark
```

Question 7 - Academic Grading (If-Elif-Else)

Implement a grading system based on numerical scores. Assign grades ranging from A to F according to the following criteria: A for scores of 90 and above, B for scores greater than 80, C for scores greater than 70, D for scores greater than 60, and F for scores below 60. After inputting a score, determine and print the corresponding grade.

```
Enter your score: 75
Your grade is C
```

Question 8 - Lego Age Restriction (Logical Operators)

Determine if a person's age allows them to play with Lego. Lego boxes state that only ages 4 to 94 can play with Lego. Implement a program that checks the user's age and informs them whether they can play with Lego or not.

```
Please enter your age: 99
You cannot play Lego
```

Question 9 - Special Offer Eligibility (Logical Operators)

Determine eligibility for a special offer. Both students and pensioners (>60) qualify for the special offer. Create a program that prompts users for their age and student status, and then inform them whether they are eligible for the special offer.

```
Enter your age: 65
Are you a student? (yes/no): no
You get the special
```

Question 10 - Even Number Checker (Logical Operators)

Check if a given number is even or uneven. Implement a program that takes a number as input and determines whether it is even or uneven. Use the "not" operator to handle the case of an uneven number.

```
Please enter a number: 5
Uneven Number!
Uneven Number!
```
