

Chapter 5: Functions – Practice Examples V1

Note: Use `main()` function from question 2 onwards.

1. Simple Print Function:

Write a function named `print_hello` that prints "Hello, World!" to the console.

2. Function with Parameters:

Define a function called `print_name` that takes a single parameter, `name`, and prints "Hello, [name]!" to the console.

3. Function with Multiple Parameters:

Create a function `print_full_name` that takes two parameters, `first_name` and `last_name`, and prints the full name in the format "[first_name] [last_name]".

4. Print User Details:

Create a function `print_user_details` that takes parameters `name` and `age` and prints "Name: [name], Age: [age]".

5. Show Double

Create a function that takes in a value and then doubles it. It should then be printed to the user

6. Bird population

Create 2 functions. One for Cape Town, and one for Potchefstroom. Call both functions that should print the bird population of that Town / City. (Use the same variable name in both functions)

7. Function Using a Loop:

Write a function `count_down` that takes a starting number and prints each number down to zero.

8. Function to Print Even Numbers:

Create a function `print_evens` that takes an integer and prints all even numbers from 0 up to that integer.

9. Function with Conditional Statements:

Define a function `greet_user` that takes a in input “Yes” or “No”. If it is morning, print "Good morning!", otherwise print "Good evening!".

10. Function to Display a Menu:

Write a function `print_menu` that prints a simple text menu with options such as:

"1. Multiply", "2. Divide", "3. Sum", and “4. Subtract”. Write another function that will ask the user for 2 numbers and then do the operation the user specified.
